Iterated integral

Multiple zeta values (MZVs)

Definition

Multiple zeta values is a real number defined by

$$\zeta(k_1, \dots, k_d) = \sum_{0 < n_1 < \dots < n_d} \frac{1}{n_1^{k_1} \dots n_d^{k_d}},$$

where $k_1, \dots, k_{d-1} \in \mathbb{Z}_{>0}$, $k_d \in \mathbb{Z}_{>1}$.

Iterated integral

Definition

For $a_0, \dots, a_{k+1} \in \mathbb{C}$ with $a_0 \neq a_1, a_k \neq a_{k+1}$, and a piecewisely smooth path $\gamma : [0, 1] \rightarrow \mathbb{C}$ from a_0 to a_{k+1} such that $\gamma((0, 1)) \subset \mathbb{C} \setminus \{a_1, \dots, a_k\}$, we define

$$I_\gamma(a_0; a_1, \dots, a_k; a_{k+1})$$

by the **iterated integral**

$$\int_{0 < t_1 < \dots < t_k < 1} \prod_{j=1}^k \frac{d\gamma(t_j)}{\gamma(t_j) - a_j} \in \mathbb{C}.$$

Remark (Iterated integral expression)

$$\zeta(k_1, \dots, k_d) = (-1)^d I(0; 1, \{0\}^{k_1-1}, \dots, 1, \{0\}^{k_d-1}; 1).$$

Yamamoto's integral

Yamamoto's integral

Example

$$I \left(\begin{array}{c} \circ \\ / \\ \bullet \end{array} \right) = (-1) I(0; 1, 0; 1) = \zeta(2)$$

Example

$$\begin{aligned} I \left(\begin{array}{c} \circ \quad \circ \\ / \quad \backslash \\ \bullet \quad \bullet \end{array} \right) &= I \left(\begin{array}{c} \circ \\ / \\ \bullet \end{array} \right) + I \left(\begin{array}{c} \circ \\ \backslash \\ \bullet \end{array} \right) \\ &= I \left(\begin{array}{c} \circ \\ / \\ \bullet \end{array} \right) + 2 I \left(\begin{array}{c} \circ \\ \backslash \\ \bullet \end{array} \right) \\ &= I \left(\begin{array}{c} \circ \\ / \\ \bullet \end{array} \right) + 4 I \left(\begin{array}{c} \circ \\ \backslash \\ \bullet \end{array} \right) \end{aligned}$$

Yamamoto's integral

Example

For $p, q, a, b, c, d \in \mathbb{C}$

$$I_\gamma(X) = I_\gamma \left(\begin{array}{ccc} & & d \\ & & / \\ & c & \backslash \\ & / & \\ a & & b \end{array} \right)$$
$$= I_\gamma(p; a, b, c, d; q) + I_\gamma(p; b, a, c, d; q).$$

The motivic version

Motivic iterated integrals

Let \mathcal{P} be the \mathbb{Q} -algebra of the ring of periods of mixed Tate motives over \mathbb{Q} . Brown defined the motivic iterated integrals

$$I_{\gamma}^{\text{m}}(a_0; a_1, \dots, a_k; a_{k+1}) \in \mathcal{P}.$$

It is known that there is a ring homomorphism called period map, which is onto and speculated to be injective.

$$\begin{array}{ccc} \text{per} : & \mathcal{P} & \rightarrow \mathbb{C} \\ & I_{\gamma}^{\text{m}}(a_0; \dots; a_{k+1}) & \mapsto I_{\gamma}(a_0; \dots; a_{k+1}) \end{array}$$

Motivic version of Yamamoto's integral

Definition

Motivic version of Yamamoto's integral $I_\gamma^m(X)$ is defined by

$$\begin{array}{ccc} I_\gamma^m(X) & := & \sum_{Y \in \text{Tot}(X)} I_\gamma^m(Y) \\ \downarrow & & \downarrow \\ I_\gamma(X) & = & \sum_{Y \in \text{Tot}(X)} I_\gamma(Y) \end{array}$$

where $\text{Tot}(X)$ is the set of all totally order which we need to consider.

Coaction fomula

Coaction on \mathcal{P}

Let $\pi : \mathcal{P} \rightarrow \mathcal{A} := \mathcal{P}/(2\pi i)\mathcal{P}$ be the natural projection to its quotient. By the theory of mixed Tate motives, there is a natural motivic coaction $\Delta : \mathcal{P} \rightarrow \mathcal{A} \otimes \mathcal{P}$. Goncharov proved the coproduct formula of motivic iterated integrals, and Brown proved its coaction version.

Theorem (Goncharov)

$$\Delta(I_{\gamma}^m(a_0; a_1, \dots, a_k; a_{k+1})) = \sum_{s=0}^k \sum_{\substack{i_0 < \dots < i_{s+1} \\ i_0=0 \\ i_{s+1}=k+1}} \prod_{p=0}^s I^{\alpha}(a_{i_p}; a_{i_{p+1}}, \dots, a_{i_{p+1}-1}; a_{i_{p+1}}) \otimes I_{\gamma}^m(a_{i_0}; a_{i_1}, \dots, a_{i_s}; a_{i_{s+1}}).$$

Infinitesimal coaction

It is known that $\mathcal{A} = \bigoplus_{k \geq 0} \mathcal{A}_k$ has a structure of graded algebra. Let $\pi' : \mathcal{A} \rightarrow \mathfrak{L} := \mathcal{A}/\mathcal{A}_{>0}^2$ be the natural projection to its quotient, where $\mathcal{A}_{>0}$ is $\bigoplus_{k > 0} \mathcal{A}_k$. Brown also proved the infinitesimal coaction D_r which is given by the following formula.

Definition

For $r \in \mathbb{N}$, the infinitesimal coaction $D_r : \mathcal{P} \rightarrow \mathfrak{L} \otimes \mathcal{P}$ is defined by

$$\begin{aligned} D_r(I_\gamma^m(a_0; a_1, \dots, a_k; a_{k+1})) \\ = \sum_{s=0}^{k-r} I^l(a_s; a_{s+1}, \dots, a_{s+r}; a_{s+r+1}) \\ \otimes I_\gamma^m(a_0; a_1, \dots, a_s, a_{s+r+1}, \dots, a_k; a_{k+1}) \end{aligned}$$

Main theorem

Main Theorem 1 (F.)

$$D_r(I_\gamma^m(X)) = \sum_{\substack{Y \in X_r \\ Y \text{ is irr.}}} \sum_{\substack{p \rightarrow_{\bar{x}} Y \\ q \leftarrow_{\bar{x}} Y}} I_{(p;q)}^l(Y) \otimes I_\gamma^m(X_{(p,\hat{Y},q)}).$$

Main Theorem 2 (F.)

This formula requires some conditions related to Y .

$$\Delta_Y(I_\gamma^m(X)) = \prod_{Z \in C_X(Y)} I_{(p_Z;q_Z)}^a(Z) \otimes I_\gamma^m(X_{\hat{Y}}).$$

Remark

$$\Delta(I_\gamma^m(X)) = \sum_{Y \subset X} \Delta_Y(I_\gamma^m(X)).$$

Examples

Examples of Theorem 2

Let us calculate

$$\Delta \left(I^m \left(\begin{array}{c} n \qquad \qquad \qquad m \\ \text{Diagram} \end{array} \right) \right).$$

using Theorem 2. By definition of motivic version of Yamamoto's integral, we have

$$\begin{aligned} \Delta(I^m(X)) &= \sum_{i=1}^n \binom{n-i+m}{n-i} \Delta(I^m(0; 1, \{0\}^i, 1, \{0\}^{(n-i)+m+1}; 1)) \\ &\quad + \sum_{j=1}^m \binom{n+m-j}{m-j} \Delta(I^m(0; 1, \{0\}^i, 1, \{0\}^{n+(m-j)+1}; 1)). \end{aligned}$$

Examples of Theorem 2

First, using the basic properties of motivic iterated integral, it is easy to show the formula

$$I^m(0; \{0\}^a, 1, \{0\}^b; 1) = (-1)^{a+1} \binom{a+b}{a} \zeta^m(a+b+1),$$

and using $\binom{i}{k} = \binom{i-1}{k} + \binom{i-1}{k-1}$, it is easy to show the formula

$$\sum_{k=0}^i (-1)^{i-k+1} \frac{m}{m+k} \binom{i}{k} = \frac{(-1)^{i+1}}{\binom{i+m}{m}}.$$

Motivic iterated integrals have the following property

$$I^m(0; 0; 1) = I^m(0; 1; 1) = I^m(a; a_1, \dots, a_k; a) = 0. \quad (k \geq 1).$$

Next, using the remark of coproduct to have

$$\Delta(I^m(X)) = \sum_{Y \subset X} \Delta_Y(I^m(X)).$$

Examples of Theorem 2

Finally, using Theorem 2 and the formula in the previous page. We have

$$\begin{aligned}
 & \Delta \left(I^m \left(\begin{array}{c} \text{Diagram: A graph with 5 nodes. The top node is white, the two middle nodes are white, and the two bottom nodes are black. The top node is connected to the two middle nodes. The two middle nodes are connected to the two bottom nodes. There are curved arrows from the left middle node to the left bottom node (labeled 'n') and from the right middle node to the right bottom node (labeled 'm'). Dotted lines connect the two middle nodes to each other and to the top node.} \end{array} \right) \right) \\
 &= \sum_{Y \subset X} \Delta_Y(I^m(X)) \\
 &= 1 \otimes I^m(X) + I^a(X) \otimes 1 \\
 &+ \sum_{i=0}^{n-2} (-1)^i I^a(0; 1, \{0\}^{m+i+1}; 1) \otimes I^m(0; 1, \{0\}^{n-i}; 1) \\
 &+ \sum_{j=0}^{m-2} (-1)^j I^a(0; 1, \{0\}^{n+j+1}; 1) \otimes I^m(0; 1, \{0\}^{m-j}; 1).
 \end{aligned}$$

Examples of Theorem 1

$$\begin{aligned}
 & D_3 \left(I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right) \right) \\
 &= I_{(○,●)}^l \left(\begin{array}{c} \text{diagram} \end{array} \right) \otimes I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right) + I_{(○,●)}^l \left(\begin{array}{c} \text{diagram} \end{array} \right) \otimes I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right) \\
 &+ I_{(●,○)}^l \left(\begin{array}{c} \text{diagram} \end{array} \right) \otimes I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right) + I_{(●,○)}^l \left(\begin{array}{c} \text{diagram} \end{array} \right) \otimes I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right) \\
 &+ I_{(●,○)}^l \left(\begin{array}{c} \text{diagram} \end{array} \right) \otimes I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right) + I_{(●,○)}^l \left(\begin{array}{c} \text{diagram} \end{array} \right) \otimes I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right) \\
 &+ I_{(○,●)}^l \left(\begin{array}{c} \text{diagram} \end{array} \right) \otimes I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right) + I_{(○,●)}^l \left(\begin{array}{c} \text{diagram} \end{array} \right) \otimes I^m \left(\begin{array}{c} n \\ \text{diagram} \end{array} \right).
 \end{aligned}$$
